

The Business OS, *reimagined.*

Documents, finances, hiring, and decisions — every operation of a company distilled into one workspace, with an AI Co-founder that reads your live data and runs alongside you.

A complete product and architecture overview: what EdgeOS is, who it is for, every feature it ships, and how each one works.

What's inside

PART I — THE PRODUCT

01	What EdgeOS Is	The one-workspace thesis
02	The Purpose	Why it exists, who it's for
03	The Shape of the App	Hub, modules, navigation

PART II — THE FEATURES

04	AI Co-founder	Flagship capability
05	Documents Module	Offers, certificates, NDA, MoU
06	Finance Module	Quotation → Proforma → Invoice → Paid
07	Team & HR Module	Registry, hierarchy, tasks, notices
08	Business Module	CRM, customers, revenue, planner
09	The Recipient Portal	Signing without an account
10	Bulk Operations	CSV in, documents out
11	Dashboard & Records	Analytics and the archive
12	Company Profile & Branding	Identity on every document
13	Onboarding & Registration	First run

PART III — THE MACHINERY

14	Architecture	Stack, layers, data flow
15	Data Model	Tables, enums, generated numbers
16	Security Model	Tenancy, RLS, secrets, tokens
17	PDF Generation	How documents are rendered
18	Email & Notifications	Outbound and inbound signals

PART IV — COMMERCIAL

19	Plans & Metering	Free, Pro, Max, Enterprise
----	------------------	----------------------------

20	Platform Administration	The operator's view
21	Feature Index	Everything, in one table

What EdgeOS Is

EdgeOS is a multi-tenant business operating system: a single web application where a company issues its documents, runs its money, manages its people, tracks its pipeline, and asks an AI that already knows its numbers what to do next.

Most small and mid-sized companies run their operations across five or six disconnected tools — a document template folder, a spreadsheet of invoices, a separate CRM, an HR tracker, an e-signature service, and a chat window with an AI that knows nothing about any of it. Every hand-off between those tools is a place where data is retyped, a status goes stale, or a follow-up is forgotten.

EdgeOS collapses that stack. One organization workspace holds every artefact the business produces — offer letters, certificates, NDAs, MoUs, quotations, proforma invoices, tax invoices, recurring billing, HR notices — alongside the people, customers, leads, tasks and expenses those artefacts refer to. Because they live in the same store, a document knows its client, a client knows its revenue, an employee knows their offer's acceptance status, and the AI knows all of it at once.

7

DOCUMENT TYPES

6

PRODUCT MODULES

25+

APPLICATION SCREENS

30+

DATABASE TABLES

The three ideas EdgeOS is built on

ONE STORE, MANY VIEWS

Every module reads the same org-scoped data layer. A paid invoice moves the revenue chart, the client's lifetime value, the finance pipeline, and the AI's context in the same instant — no sync step exists to fail.

DOCUMENTS ARE LIVE OBJECTS

A document is not a PDF in a folder. It is a row with a status, a recipient, a signature, a portal link, and a lifecycle: draft → sent → viewed → accepted / paid / declined. The PDF is just one rendering of it.

AI AS A COLLEAGUE, NOT A CHATBOT

The Co-founder is wired into the live workspace. It answers from your actual financials and headcount, and it can act — creating employees, assigning tasks, drafting follow-ups — rather than only talking.

RECIPIENTS NEED NO ACCOUNT

Candidates, clients and employees interact with documents through signed, expiring portal links. They sign, accept, decline or confirm payment without ever creating a login or touching the database.

What a day in EdgeOS looks like

IN ONE SENTENCE

EdgeOS is the workspace where a company's paperwork, money, people and decisions stop being four separate problems.

The Purpose

EdgeOS exists to give a small team the operational surface area of a large one — without the headcount, the tool sprawl, or the licence stack that normally buys it.

The problem it solves

A founder-led company spends a disproportionate share of its early life on operations that produce no product: drafting an offer letter in a word processor and hoping the formatting holds; chasing a client for a signature over email; rebuilding an invoice's GST split by hand; not knowing, at any given moment, how much money is outstanding. None of this work is hard. All of it is expensive, because it is done by the people whose time is worth the most.

The second problem is that this work is *fragmented*. The offer letter lives in a drive, its acceptance lives in an inbox, the new hire lives in a spreadsheet, and their first task lives in a chat message. Nothing can answer "what is the state of this hire?" without a person assembling it.

What EdgeOS does about it

THE FRICTION	HOW EDGEOS REMOVES IT
Documents take hours to produce	Structured forms + typeset PDF templates generate legal-grade offers, certificates, NDAs, MoUs, quotations and invoices in seconds, pre-filled with the org's branding, signatory, logo, stamp and signature.
Signatures require a paid e-sign tool	Built-in recipient portal with drawn-signature capture, delivered as a signed, expiring, revocable link. No account for the recipient, no per-envelope fee.
Nobody knows a document's status	Every document carries a lifecycle status updated by the recipient's own actions, surfaced in the Offer Tracker and Finance Status pipeline views.
Financial position is a spreadsheet exercise	Revenue, pending receivables, expenses and profitability are computed continuously from the same documents that were issued — nothing is entered twice.
Advice requires context you have to supply	The AI Co-founder is given the live context automatically: revenue, growth rate, document counts, team, customers, and a persistent memory of company facts, risks and opportunities.
Scale means retyping	Bulk operations turn a CSV into dozens of validated documents, each with its own portal link, in one pass.

Who it is for

FOUNDERS & SOLO OPERATORS

Running the whole company alone. Need to look established from the first document and need decisions sanity-checked against real numbers.

SMALL & GROWING TEAMS

Hiring in batches, invoicing regularly, tracking a pipeline. Need shared state, roles and a record of who issued what.

AGENCIES & CONSULTANCIES

Quotation-led sales, proforma advances, recurring retainers, NDAs and MoUs with every new client relationship.

HR & OPERATIONS LEADS

Onboarding cohorts, issuing certificates, maintaining the org chart, sending role changes and exit notices with an auditable trail.

Design principles

- **Calm over dense.** A monochrome, typographic interface with light and dark themes. Structure carries the meaning; colour is reserved for status.
- **Never invent data.** The AI is constrained to the workspace's real figures; when it lacks a fact it asks rather than fabricating.
- **Fail closed.** Every table denies access by default; every server route authenticates before it acts; a recipient's browser has no database access at all.
- **Instant paint.** A local mirror of the org's data renders the workspace immediately on load, then reconciles against the server.

The Shape of the App

EdgeOS is organised as a public marketing site, an authenticated workspace of six modules, and a public recipient portal — three surfaces, one data store.

Surface one — the public site

A parallax landing page introduces the product, followed by twelve dedicated sub-pages: AI Co-founder, Pricing, Invoicing, Offer Letters, Legal Documents, Certificates, Documentation, Support, Changelog, Privacy, Terms and Security. Each is lazily loaded, so the marketing surface costs nothing to visitors who go straight to the app.

Surface two — the workspace

After sign-in the user lands on **the Hub**: six large module tiles that filter the sidebar to the work at hand, so the navigation never shows twenty-five items at once.

MODULE	PURPOSE	SCREENS IT CONTAINS
Overview	Comprehensive analytics and business stats	Dashboard
Team	Employee registry, offer tracker & bulk imports	Team Hierarchy, Employees, Offer Tracker, Ex-Employees, Task Board, Bulk Team Members
Documents	Offer letters, NDAs, MoUs and certificates	Offer Letters, Certificates, NDA, MoU, Bulk Offers, Bulk Certificates
Finance	Invoices, quotations, proformas & financial status	Finance Status, Invoices, Quotations, Proforma, Recurring
Business	CRM pipeline, client database and revenue analytics	CRM, Customers, Billing & Revenue, Product Planner
Records	Past documents and bulk operation history	Records, Bulk History

Persistent across every screen: the **AI Co-founder panel** (dockable side panel or fullscreen), a **notification bell** polling for recipient activity, a **light/dark theme toggle**, the active **plan badge**, and the company profile entry point.

Surface three — the recipient portal

A standalone route reachable only with a signed token. Candidates, clients and employees open it to read a document, sign it, accept or decline it, request a revision, or confirm a payment. It shares no code path with the authenticated app and no database credentials.

Responsiveness and theming

Every screen adapts below 768 px: the sidebar collapses to an overlay drawer, the CRM board becomes column-switched rather than side-scrolled, and the Co-founder panel goes fullscreen instead of docking. The theme is a CSS-variable palette resolved at runtime — charts read their tooltip, axis and grid colours from the same variables, so light and dark are genuinely one design rather than two.

The AI Co-founder

Not a chatbot bolted to a sidebar. A colleague that reads the live workspace, makes structured decisions, drafts outbound messages, performs HR operations, and remembers what it learns about the company.

The Co-founder runs on `meta/llama-3.1-8b-instruct` served through NVIDIA's API, proxied by a server route so the API key never reaches the browser. It is tuned for sub-seven-second responses and streams tokens as they arrive.

How it knows your business

Before any message is sent, EdgeOS assembles an **Edge Context** object from the live workspace and injects it into the prompt:

CONTEXT BLOCK	WHAT IT CARRIES
Financials	Total revenue, pending revenue, average monthly revenue, last month's revenue, growth rate, invoices issued / paid / pending
Documents	Total documents, offer letters, invoices, quotations, proformas
Trends	Month-by-month revenue series and document growth
Team	The signed-in user and their role
Memory	Persistent company facts, insights, opportunities and risks

Company Memory

Memory is one durable record per organization holding structured **facts** (company name, industry, team size, country, city, website, description, and key metrics such as revenue, headcount, lead and customer counts, and per-type document counts) plus three evolving lists: **insights**, **opportunities** and **risks**. It is refreshed from live org data and enriched by a guided onboarding conversation the Co-founder runs the first time you talk to it. Only the memory relevant to the current question is retrieved and injected, so context stays tight.

Five modes it switches between

1 · Answering

Direct questions — "how much is outstanding?", "how many offers did we send this quarter?" — are answered from the injected context. Query intent is detected first so the right slice of data and memory is retrieved rather than the whole workspace.

2 · Decision Mode

When a message reads as a decision rather than a question — "should we hire another designer?", "is now the right time to raise prices?", "help me decide between..." — the Decision Engine takes over. Instead of answering immediately it asks a short series of multiple-choice clarifying questions, then returns a structured recommendation:

Decision — the recommended course of action.

Why — the reasoning, as discrete points.

Risks — what could go wrong.

Next step — the single concrete action to take now.

Detection is pattern-based, not keyword-triggered, and deliberately excludes factual prefixes ("what is", "how many", "list", "generate") so that plain queries are never hijacked into a questionnaire.

3 · Follow-up drafting

Phrases like "follow up with...", "chase...", "any update from...", "haven't heard back" trigger the Follow-Up Engine. It fuzzy-matches the named person against the employee registry, then drafts a paired **email** and **WhatsApp** message in one of three tones — *polite*, *firm* or *urgent* — carrying the recipient's real name, role, department, email and phone. The draft is presented for review, not sent silently.

4 · Employee operations

The Employee AI engine recognises four conversational operations — **create**, **edit**, **role change** and **terminate** — and walks the user through them step by step inside the chat, collecting one field per turn without spending AI tokens on the mechanical steps. An advisory guard prevents "should I hire someone?" from being mistaken for "hire someone": questions and hypotheticals stay conversational.

5 · Task assignment

"Assign the deck to Priya by Friday" is detected as a task intent, the assignee resolved against the registry, the deadline parsed from natural language, and a task written to the board — with the Co-founder able to draft the accompanying nudge when it comes due.

Guardrails

- **Always context-aware, never inventive.** The model is grounded in the injected figures and instructed not to fabricate numbers it was not given.
- **Metered server-side.** Every accepted request increments the org's AI message counter on the server, so the plan limit cannot be bypassed by a client that declines to count itself.
- **Authenticated and org-scoped.** The proxy route requires a valid session and org membership; it is same-origin only.
- **Your data is not training data.** The workspace context is used to answer your questions and nothing else.

Documents Module

Four HR and legal instruments, each with a structured form, a live preview, a typeset PDF, a portal link and a tracked lifecycle.

Offer Letters

The workhorse. A form captures the candidate, role, department, employment type (*full-time, intern, contract, part-time*), compensation and frequency, start date, reporting manager, location and joining conditions. The org's letterhead — logo, tagline, CIN, registered address, phone, email, website — is composed into the document header automatically, and the authorised signatory's name, designation, signature image and company stamp are placed in the sign-off block.

Acceptance is a real signature: the candidate draws it in the portal, it is stored in a private bucket, and it is composited into the executed copy. The Offer Tracker (Chapter 07) is the operational view over every offer in flight.

Certificates

Achievement, completion and internship certificates issued to a named recipient. Certificates are rendered through a high-fidelity canvas capture rather than plain text layout, so the ornamental template — borders, seals, calligraphic titling, the company stamp and signature — prints exactly as previewed. Certificates carry their own generated number and land in Records like any other document.

Non-Disclosure Agreements

A legal-grade NDA between a disclosing and a receiving party. The form captures both parties' legal names and addresses, the purpose of disclosure, the definition of confidential information, the term, the governing jurisdiction and the effective date. The document supports a two-stage signature flow: the issuing party signs, the status becomes *party A signed*, and the recipient counter-signs in the portal to reach *fully signed*.

Memoranda of Understanding

For partnerships and collaboration frameworks. Captures both parties, the scope of collaboration, the responsibilities of each side, the duration, and the terms. Like the NDA it is a counter-signed instrument, and the portal presents the recipient with an explicit *MoU sign* action that records their drawn signature against the document.

What every document shares

CAPABILITY	DETAIL
Generated number	Allocated by the server at save time from a per-org, per-type counter — never a client-side count, so two people saving at once cannot collide. Prefixed by type (OL, CERT, NDA, MOU, QUO, PI, INV).
Live preview	The form renders the finished document beside the inputs as you type.
PDF export	Download at any point, before or after signature.
Portal link	A signed, expiring URL for the recipient, with a view-only or sign scope.
Email delivery	Sent from the organization's own mailbox with the link and document attached.
Status lifecycle	draft · sent · viewed · accepted · declined · signed · party A signed · fully signed · acknowledged · expired · cancelled.
Archived	Filed in Records, searchable and re-downloadable indefinitely.

Finance Module

The full commercial pipeline — quote a client, collect an advance, invoice the balance, record the payment — with Indian GST handled correctly at every step.

The pipeline

Quotations

A priced proposal with line items, quantities, unit prices, discounts and validity. Sent to the client through the portal, where they can **accept**, **decline** with a reason, or **request a revision** — each of which updates the quotation's status and raises a notification in the workspace. An accepted quotation converts forward into a proforma or invoice without re-entry.

Proforma invoices

The advance-payment instrument. Carries the same line items plus an advance amount or percentage, and tracks partial payment: the recipient can confirm they have paid, attaching a reference, and the document moves to *partially paid* until the balance is settled.

Tax invoices

A complete GST invoice. Line items carry a description, HSN code, quantity, unit price and making cost; the form computes subtotal, discount, taxable value and tax at the selected rate (0, 5, 12, 18 or 28 percent). Crucially, the split is **place-of-supply aware**: when the seller's and buyer's states match, tax is divided into CGST and SGST; when they differ, it is levied as IGST. Seller and buyer GSTIN, both addresses, the invoice and due dates and the payment terms are all recorded on the document.

Recurring invoices

Retainers and subscriptions. A recurring definition holds the client, the line items and the cadence, and issues invoices on schedule so monthly billing is set up once rather than rebuilt every cycle.

Getting paid

UPI QR CODE

Every invoice can carry a generated UPI QR encoding the org's UPI ID, payee name, exact amount and a transaction note — scanned straight from the PDF or the portal, with the ID also shown as copyable text.

BANK DETAILS

Account name, number, IFSC and branch are held in a separate, admin-only record and printed on the documents that need them.

PAYMENT CONFIRMATION

The recipient submits a confirmation with reference and date from the portal; it is recorded against the document as a payment and the amount-paid total is recomputed.

AUTOMATIC TOTALS

Line-item totals, document totals and amount-paid are recomputed by the database itself whenever items or payments change — the figures cannot drift from their parts.

Finance Status — the pipeline view

A single screen showing every financial document grouped by client, with each relationship placed on the four-stage pipeline (quotation → proforma → invoice → paid), its total value, and its latest status. Searchable and filterable by type and status, with the portal link for any document one click away. This is the answer to "where does every deal actually stand?"

Alongside it, dedicated list screens for Invoices, Quotations, Proformas and Recurring invoices provide the per-type working views, with status changes, duplication, and PDF download in place.

Team & HR Module

The people side: who works here, who reports to whom, what they are working on, and every formal notice issued to them.

Employee Registry

The system of record for the internal team. Each employee row holds their name, email, phone, role, department, employment type, joining date, reporting manager and status. Compensation is deliberately stored in a **separate record visible only to owners and admins**, so a member of the team can be shown the registry without being shown everyone's salary.

HR notices

Two formal instruments are issued directly from an employee's row:

NOTICE	CONTENTS	RECIPIENT ACTION
Role Change	Current and new role, current and new department, effective date, new salary and frequency, and a personal message — on company letterhead.	Acknowledge in the portal; the registry is updated and the manager is notified.
Termination	Current role and department, last working day, and a message.	Acknowledge in the portal; the employee moves to the Ex-Employees archive.

Both are real documents — numbered, stored in the same record table as offers and certificates, linked to the employee, delivered by portal link, and permanently archived.

Ex-Employees

A separate archive of everyone who has left, preserving their record, their documents and the notice that ended the relationship — so the registry stays current without losing history.

Team Hierarchy

A visual, interactive org chart. Employees appear as draggable nodes; reporting lines are drawn by connecting them. Nodes are coloured by department from a stable palette, so the shape of the organisation is legible at a glance, and the layout is saved back to the workspace. Departments can be created, renamed and recoloured inline, and the chart pans, zooms and collapses branches.

Offer Tracker

Real-time acceptance status for every offer letter sent. Each row shows the candidate, role, the offer's number, when it was sent, and a colour-coded status pill — draft, pending, sent, viewed, accepted, declined, acknowledged. From the row you can resend by email, copy the portal link, share by message, edit the offer, or delete it. Declines carry the candidate's stated reason. This is where a hiring pipeline is actually managed.

Task Board

Assign and track work across the team. A task holds a title, description, assignee (resolved to a real employee with their email, phone, role and department), status (*pending, in progress, done, overdue*), priority (*low, medium, high*), a deadline and notes. A background deadline monitor continuously reclassifies tasks that pass their due date as overdue and surfaces those due today — and the Co-founder can draft the follow-up nudge for whoever is late, recording when it was sent.

Business Module

Demand and money: the pipeline that brings work in, the clients it comes from, the profitability it produces, and the roadmap it funds.

CRM

A drag-and-drop pipeline board with four columns — **Lead** → **Contacted** → **Deal** → **Not Deal**. Each card carries the contact's name, email, phone, company and free-form notes, and is moved between stages by dragging (or, on mobile, by switching the visible column). The board is searchable across every field.

Crucially, the CRM is not a silo: when a lead reaches *Deal*, it flows into the customer database, and the quotations and invoices raised against that customer feed back into the relationship's value.

Customers

The client database. Each customer holds their company name, contact person, email, phone, billing address, state (which drives the GST place-of-supply calculation) and GSTIN. Selecting a customer on an invoice or quotation auto-fills every one of those fields, so a repeat client is never retyped — and the customer list is kept in sync with the documents issued against it.

Billing & Revenue

The profitability view. It combines income — computed from issued and paid financial documents — with an expense ledger you maintain in place, categorised across Operations, Marketing, Salaries, Tools & Software, Office, Travel and Other.

VISUALISATION	WHAT IT ANSWERS
Revenue area chart	How income has moved month over month
Income vs expense bars	Whether the business is actually profitable in each period
Expense breakdown pie	Where the money goes, by category
Headline figures	Total revenue, pending receivables, total expenses, net position

Expenses are added with a description, amount, category and date directly on the screen; the charts recompute immediately.

Product Planner

A lightweight roadmap for products and projects. Each item carries a name, description, status (*planned*, *in progress*, *completed*), priority (*low*, *medium*, *high*) and due date, and the board can be filtered to any status. It is intentionally small — enough to hold the plan next to the operations that fund it, without becoming a second project-management tool.

The Recipient Portal

The half of EdgeOS your customers and candidates actually see: a document, a signature pad, and a decision — with no account, no download, and no access to anything else.

How a link is issued

From any document you generate a portal link. The request goes to the server, which verifies you are signed in and a member of the organization that owns the document, then mints a token row and returns a URL. The token has three parts: an **identifier** for the row, an **expiry** in seconds, and an **HMAC signature** over both.

The signature makes the token unguessable and unforgeable offline. The stored row is what makes it **revocable** and **auditable** — you can see when it was used and cut it off. Both are checked on every single request. Links expire after a default thirty days, configurable up to a year, and are scoped either *view* or *sign*.

What the recipient can do

ACTION	APPLIES TO
Accept offer	Offer letters — draws a signature, which is stored privately and composited into the executed letter
Sign	NDAs and MoUs — counter-signature completing a two-party instrument
Acknowledge	Role-change and termination notices — recorded receipt, which updates the employee registry
Accept quotation	Quotations — moves the deal forward in the finance pipeline
Decline	Any document, with a stated reason returned to the issuer
Request revision	Quotations and proposals — asks for a change instead of a flat no
Confirm payment	Invoices and proformas — submits a payment reference and date
Download PDF	Every document type

Why it is safe

The recipient's browser holds **no database credentials of any kind**. The anonymous role has no grants on any table, so there is nothing for a curious visitor to query. Every read and write goes through one server endpoint that

verifies the token and then acts under a privileged server identity *scoped strictly to the single document that token names*.

The scoping is deliberate down to the field level. An invoice recipient is shown the invoice — but not the payment ledger behind it, which would expose other parties' transaction references. Company branding needed to render the document (logo, stamp) is served from a public bucket; signatures are served from a private one through short-lived signed URLs.

Signals back to the workspace

Every portal action raises a notification in the issuing organization — an offer was signed, a document was declined, a quotation was accepted, a payment was confirmed, a notice was acknowledged — and clicking it navigates straight to the relevant screen.

Bulk Operations

Hiring a cohort, certifying a batch, importing a team. A spreadsheet goes in; validated, numbered, individually-linked documents come out.

The four bulk tools

TOOL	INPUT
Bulk Offer Letters	Candidate name, role, department, salary, start date, manager, location, email
Bulk Certificates	Recipient name, achievement, programme, date, email
Bulk Team Members	Full employee registry import — name, role, department, contact, joining date, manager
Bulk History	A record of every bulk job run, its size, and its outcome

The pipeline

Validation before generation

The uploaded file is parsed into a validation table showing every row with its problems highlighted: missing required fields, malformed email addresses, unparseable dates. Dates are normalised from whatever format the spreadsheet used. Nothing is generated until the batch is clean, so you never end up with forty documents and three wrong ones somewhere in the middle. A downloadable sample file documents the expected columns.

Templates and signatures

A batch is generated against a chosen template — standard full-time offer, internship offer, executive contract — and a signature captured once on a signing pad is applied across the whole run.

Generation and distribution

A progress tracker reports each document as it is created. Every generated document appears as its own card with its number, its recipient, its PDF download and its **own signed portal link** — so a cohort of thirty candidates each receives a link that only opens their letter. Links are copyable individually or dispatched by email in one pass.

AVAILABILITY

Bulk generation is an Enterprise capability. The tools are visible on other plans so the workflow is discoverable, but batch execution is gated.

Dashboard & Records

The Dashboard

The organization at a glance, assembled from every module at once.

The dashboard reads the record archive, the financial documents and the employee registry together and presents:

- **Headline counters** — total documents, offer letters, certificates, legal documents, invoices, employees, and revenue.
- **Revenue trend** — a month-over-month area chart with the growth rate stated in plain numbers.
- **Document mix** — a breakdown of what the organization actually produces, by type.
- **Activity feed** — the most recent documents issued, with their status, and a click through to each.
- **Company identity card** — the organization's name, industry, location, size and website, drawn from the profile.
- **Quick actions** — direct routes into the forms that are used most.

Every chart reads its colours from the active theme, so the dashboard is fully legible in both light and dark modes rather than being a light-mode design shown on a dark page.

Records

The permanent archive of everything the organization has ever issued.

Every document — offer letters, certificates, NDAs, MoUs, role changes, terminations — is filed here on creation, sorted newest first, and never silently discarded. From a record you can:

- Search and filter by type, recipient and status
- Re-download the PDF exactly as issued
- Re-issue or copy the recipient portal link
- Inspect the current lifecycle status and the recipient's response
- Delete, subject to role — deletion is restricted to owners and admins

Bulk History

A parallel archive for batch jobs: what was run, when, how many documents it produced, and the outcome of each — so a cohort generated three months ago can be found as a unit rather than as thirty unrelated records.

Notifications

A bell in the header carries an unread count, refreshed continuously. Notifications are raised by recipient activity — an offer signed, a document declined, a quotation accepted or sent, a payment confirmed, a role change or termination acknowledged — and each one routes directly to the screen where it can be acted on. Read state is tracked per user, so one person clearing a notification does not hide it from the rest of the team.

Company Profile & Branding

One profile drives the appearance of every document EdgeOS produces.

What the profile holds

GROUP	FIELDS
Identity	Company name, tagline, description, industry, website, size, founding details
Legal & tax	CIN, GSTIN, registered address, country, city, state
Contact	Company email, phone, contact person, and the designation printed on documents
Banking	Account name, number, IFSC, branch, UPI ID — held separately, admin-only
Branding assets	Logo, authorised signature, company stamp
Email credentials	The organization's own sending mailbox, stored encrypted server-side

How branding assets are handled

Logos, signatures and stamps are uploaded through an in-app image editor that crops and positions them, then re-encoded to **WebP** — which preserves transparency like a PNG at roughly a quarter of the bytes — and stored as real files in object storage rather than embedded in the database.

- **Logos and stamps** live in a public bucket, because recipients open documents that display them without having an account. Limit 2 MB, resized to 512 px.
- **Signatures** live in a private bucket and are only ever served through short-lived signed URLs. Limit 1 MB, kept wide and short so they print correctly.
- **Generated PDFs** live in a private bucket with a 20 MB ceiling.

Every stored object is pathed under its organization's identifier, and access is policed on that path — so one tenant's assets are structurally unreachable from another's.

Onboarding & Registration

A conversational, one-question-at-a-time setup that turns a sign-up into a fully configured organization.

Authentication

Sign in with email and password or with Google. Sessions are managed by the platform's auth service; a user who signs in without an organization is routed into registration, and one who already belongs to an organization goes straight to the Hub.

The registration wizard

Eighteen questions, presented one per screen with a progress bar, each phrased as a sentence rather than a form label. Progress is saved as you go, so an interrupted setup resumes where it stopped.

1. Official company email address
2. Administration password
3. Organization / brand name
4. Company website or online presence *(optional)*
5. Industry — Technology, Finance, Healthcare, Education, E-commerce, Agency/Consulting, Real Estate, Other
6. A one-or-two-line description of the business
7. Headquarters country
8. Operating city
9. Organizational scale — Solo, 2–10, 11–50, 50+
10. Your full name, as primary administrator
11. Your operational role — Founder, HR, Admin, Manager, Other
12. Primary contact person for documents *(optional)*
13. Preferred designation on official documents
14. Intended use — Offer Letters, Certificates, MoUs, Reports, Team Management
15. Whether to include the company logo on documents
16. Logo URL, if so *(skipped automatically if not)*
17. Account scope — just me, small team, entire organization
18. How you discovered EdgeOS *(optional)*

What happens on completion

A single transactional operation on the server creates everything the workspace needs at once: the **organization**, the owner's **membership**, a default **department**, the founder's own **employee record**, the organization's

settings, its **subscription** on the Free plan, its **usage counters**, and its **banking record**. Because it is one transaction, a half-created organization is not a state that can exist. The client cannot create an organization by any other route.

Immediately afterwards the AI Co-founder runs its own guided onboarding conversation, capturing the softer facts — what the company does, what it is trying to achieve, what is currently hard — into Company Memory, so its first substantive answer is already informed.

Architecture

A React single-page application over a Postgres-backed platform, with a thin layer of server functions for everything the browser must not be trusted with.

Technology

LAYER	TECHNOLOGY
UI framework	React 19 with React Router 7
Build	Vite 7, ES modules, lazy-loaded marketing routes
Styling	Hand-written CSS design system with runtime theme variables
Charts	Recharts, themed from the same CSS variables
Org chart	React Flow — draggable nodes and connectable edges
Motion	Framer Motion for transitions and progress states
Icons	Lucide
PDF	jsPDF, with canvas capture for ornamental templates
Spreadsheets	SheetJS for CSV and XLSX import/export
Signatures	Canvas-based signature pad
QR codes	UPI payment QR generation
Database, auth, storage	Supabase — Postgres with row-level security, authentication, object storage and realtime
Server functions	Node serverless routes (Vercel-style), deployed alongside the app
AI	NVIDIA-hosted Llama 3.1 8B Instruct, proxied server-side
Email	Nodemailer over the organization's own Gmail SMTP

The layers

Components — screens and forms. They never talk to the database directly.

Services — a domain layer: the org store, the document store, employee, customer, portal, email, PDF and image services, plus the AI engines. Every component goes through these.

Data layer — one org-scoped store that hydrates every section of the workspace in a single batch on load and keeps an in-memory cache, so screens read synchronously and render instantly.

Server routes — email, AI proxy, portal token minting, portal actions, org secrets and platform administration. Anything the browser must not be able to do lives here.

The org store

The centre of the client architecture. On sign-in it loads every section of the active organization — employees, departments, tasks, customers, leads, products, expenses, records, financial documents — in one batch, translating database rows into the shapes the components expect. Reads are synchronous against the in-memory cache; writes go to the server and update the cache. A local mirror gives an instant first paint on reload, treated strictly as a *cache* and never as a queue of unsent writes, so there is exactly one authoritative copy of the truth.

Realtime

The store subscribes to database change streams for the active organization, so a document signed by a recipient, a task completed by a colleague, or a status changed on another device appears without a refresh.

The Data Model

Roughly thirty tables, every one of them keyed to an organization, with the invariants enforced by the database rather than by hope.

The tables

GROUP	TABLES
Tenancy	organizations, memberships, org_settings, invitations
Sensitive	org_banking, org_secrets
Commercial	subscriptions, usage_counters
People	departments, employees, employee_compensation, tasks
Business	customers, crm_leads, products, expenses
Documents	records (HR & legal), financial_documents, document_line_items, payments, recurring_invoices, document_signatures, document_counters
Delivery	portal_tokens, notifications, notification_reads
Intelligence	ai_company_memory
Operational	audit_log, legacy_id_map

The vocabularies

ENUM	VALUES
Member role	owner · admin · member · viewer
Document type	offer · certificate · nda · mou · role_change · termination · invoice · quotation · proforma
Document status	draft · pending · sent · viewed · accepted · declined · signed · party_a_signed · fully_signed · acknowledged · paid · partially_paid · overdue · cancelled · expired
Employment type	fulltime · intern · contract · parttime
Task status	pending · in_progress · done · overdue
Task priority	low · medium · high
Plan tier	free · pro · max
Discount kind	percent · flat

What the database enforces on its own

GUARANTEE	MECHANISM
Document numbers never collide	A dedicated function allocates the next number per organization and per type at save time, from a counter table — not from a client-side count.
Numbers never change	A trigger freezes the document number after it is assigned.
Rows never move tenant	A trigger freezes the organization identifier on every row.
Totals always match their parts	Line-item totals, document totals and amount-paid are recomputed by trigger whenever items or payments change.
Usage counters stay honest	Document creation bumps the organization's usage counters through a trigger, with a rebuild function available for reconciliation.
An org always has an owner	A trigger refuses to remove or demote the last owner.
Timestamps are automatic	An update trigger maintains modification times across every table.
Organizations are created whole	A single transactional function creates the org, membership, department, founder record, settings, subscription, counters and banking together.
Invitations are safe to accept	Acceptance is a transactional function, not a client-side insert.

The Security Model

Multi-tenancy is not a filter in the application code. It is enforced in the database, on every row, for every request.

Row-level security

Row-level security is enabled on every table, and any table added later without a policy **fails closed** — it is unreadable rather than open. The shape of the model:

ACCESS	RULE
Read	Must be a member of the row's organization
Write	Must be a member, excluding the viewer role
Delete	Owner or admin only
Money & PII	Banking details and employee compensation: owner or admin only
Secrets	Security enabled, <i>no policy at all</i> — no client role can ever read the mail credentials table
Subscriptions	Readable, with no write policy — a plan cannot be self-granted from the browser
Audit log	Readable by admins; insert, update and delete denied to every client role

Roles

Four membership roles govern the workspace: **owner** (full control, including other members and billing), **admin** (full operational control including deletes and sensitive records), **member** (create and edit, no deletes, no compensation or banking), and **viewer** (read-only). Above them sits a **platform administrator** claim used only by EdgeOS operations, which grants cross-tenant read and nothing else — every destructive operator action is routed through an authenticated server endpoint instead.

Server-side authority

Five things are impossible from the browser by design, and are done only by authenticated server routes:

1. **Sending email** — the client sends the organization and its session token; the server reads the mailbox credentials itself.
2. **Calling the AI** — the request is authenticated, org-scoped and metered before it is forwarded.
3. **Minting a portal link** — only a verified member of the owning organization can create one, and only against a document that organization actually owns.

4. **Portal reads and writes** — performed under a privileged identity, scoped to the one document the token names.
5. **Platform administration** — changing a plan or deleting an organization requires the platform admin claim, which only the server identity can set.

Secrets at rest

The organization's mail password is encrypted with **AES-256-GCM** using a key held only in the server environment, and stored as separate ciphertext, initialisation vector and authentication tag columns kept consistent by a database constraint. A database dump on its own yields nobody's credentials. The password is never sent back to the browser — the settings screen reports whether one is configured, not what it is.

Portal tokens

Signed with HMAC-SHA-256 over the token identifier and expiry, verified with a constant-time comparison, checked against a stored row on every request, and expiring on a configurable schedule. Signature makes them unforgeable; the row makes them revocable.

TENANT ISOLATION IS TESTED

The schema ships with an isolation test suite that asserts one organization cannot read or write another's rows — the property is verified, not assumed.

PDF Generation

Documents are typeset, not exported. EdgeOS lays out each page itself so the result is identical every time, on every machine.

The document header

Every business document opens with a composed letterhead: the organization's logo and tagline on the left, and on the right its legal name, CIN, registered address, phone, email and website. The logo is measured and scaled to preserve its aspect ratio within a fixed height, and the header returns the vertical position where the body begins — so content flows correctly whether the logo is tall, wide or absent.

Layout

Documents are laid out on A4 with consistent margins and a typographic hierarchy: title block, reference number and date, addressee, body clauses, tables where the document carries line items (with per-column alignment for descriptions, HSN codes, quantities, rates and amounts), tax summary, terms, and the sign-off block carrying the signature image, the signatory's name and designation, and the company stamp.

Two rendering paths

TYPESET

Offers, NDAs, MoUs, invoices, quotations, proformas and notices are drawn instruction by instruction — real text, selectable and searchable, with precise control over pagination.

CANVAS CAPTURE

Certificates, whose ornamental templates depend on exact visual fidelity, are captured from the rendered preview at high resolution so what you saw is exactly what prints.

Signatures and stamps are fetched from private storage through short-lived signed URLs and composited into the page at generation time; the executed copy of a signed document carries the recipient's own drawn signature.

Email & Notifications

Outbound email

Every message goes out from the organization's own mailbox, so recipients see the company, not a platform.

Email is sent through the organization's Gmail account over SMTP. The credentials are configured once in the company profile — a mailbox address and an app password — and from that moment the browser never holds them. When the app sends a message it transmits the organization identifier and the user's session token; the server authenticates the caller, confirms their membership, reads the encrypted password from the secrets table, decrypts it, and sends.

The single exception is the "test connection" button in the profile settings, where the user is typing a credential that has not been saved yet. Even then a valid session and an admin role are required, and the test message can only be sent to the address being tested.

What gets sent

- Offer letters, certificates, NDAs and MoUs with their portal link and PDF
- Quotations, proformas and invoices to clients
- Role-change and termination notices to employees
- Follow-ups drafted by the AI Co-founder, after review
- Task reminders and deadline nudges
- Bulk distributions — one personalised message per recipient in a batch

Inbound signals

Notifications are database rows with per-user read state rather than a single shared array, so each team member has their own inbox. They are raised by recipient activity:

EVENT	WHERE IT TAKES YOU
Offer signed	Offer Tracker
Document declined	Offer Tracker or Finance Status, by type
Role change acknowledged	Offer Tracker
Termination acknowledged	Offer Tracker
Quotation accepted or sent	Finance Status
Payment confirmed	The invoice or proforma
Task overdue	Task Board

The bell shows an unread count, the panel lists the events, and clicking one clears it and navigates straight to the screen where it can be resolved.

Plans & Metering

Four tiers, from a no-card free plan to white-glove enterprise. Limits are counted on the server, not requested politely of the browser.

	FREE	PRO	MAX	ENTERPRISE
Price	\$0	\$12 /mo <i>billed annually</i>	\$54 /mo <i>billed annually</i>	Custom
Offer letters	5	25	Unlimited	Unlimited
MoU	1	5	Unlimited	Unlimited
NDA	1	5	Unlimited	Unlimited
Invoices	5	20	Unlimited	Unlimited
Quotations	5	20	Unlimited	Unlimited
AI Co-founder messages	10	50	Unlimited	Unlimited
Recipient portal	Yes	Yes	Yes	Yes
Priority support	—	Yes	Yes	Yes
Team follow-up automation	—	—	Yes	Yes
Bulk generation	—	—	—	Yes

Enterprise, beyond Max

- Bulk document generation across all types
- Data migration from Tally, Zoho and SAP
- White-label and custom branding
- Aadhaar eSign integration
- A dedicated account manager

How metering works

Every organization carries a usage counter record. Document creation increments it through a database trigger — so the count reflects what was actually written, not what the client claimed to write — and AI messages are counted on the server before the request is forwarded, because a caller that increments its own meter can simply decline to. A reconciliation function can rebuild counters from the underlying rows at any time.

In the app, the current plan is shown as a badge in the header, and each limited feature reports its remaining allowance and a usage percentage, so the ceiling is visible before it is reached rather than at the moment something is blocked.

Buying

Plans are sold consultatively. Each pricing tier opens a pre-composed message to the EdgeOS team covering plan fit for the team's size and use case, setup and any data migration, the onboarding timeline, and billing options — with a response inside one business day and a short onboarding call. Payment is taken by UPI, bank transfer or invoice. Plans can be changed at any time; usage limits reset each billing cycle and any pro-rated balance is applied to the next invoice.

Platform Administration

| *A separate operator console for the EdgeOS team, gated by a claim only the server can grant.*

The admin surface lists organizations across the platform with their plan, size and activity, and supports two operations: **setting an organization's plan** and **deleting an organization**. Both go through an authenticated server endpoint.

The platform administrator's own database policies grant cross-tenant *read* and nothing else, so even a compromised operator session cannot mutate a customer's data directly from a browser — every destructive action has to pass through the server route, where the claim is verified again.

A setup script provisions the first platform administrator, and a connectivity script verifies the database configuration — administration is a deliberate, scripted act rather than a flag someone can set for themselves.

Auditability

An append-only audit log records significant actions. It is readable by administrators and writable by no client role at all — entries cannot be edited or deleted from the application, only added by the system.

Feature Index

| *Everything EdgeOS ships, in one table.*

FEATURE	WHAT IT DOES
AI Co-founder	Context-aware assistant over live business data; answers, decides, drafts, and acts
Decision Mode	Structured recommendation with reasoning, risks and a next step, after clarifying questions
Follow-Up Engine	Paired email and WhatsApp drafts in polite, firm or urgent tone, addressed to a real contact
Employee AI	Conversational create, edit, role change and terminate flows
Company Memory	Persistent facts, insights, opportunities and risks per organization
Offer Letters	Full-time, intern, contract and part-time offers with branded letterhead and signature
Certificates	High-fidelity achievement and completion certificates
NDAs	Two-party confidentiality agreements with counter-signature
MoUs	Collaboration frameworks with counter-signature
Quotations	Priced proposals with accept, decline and revision-request flows
Proforma invoices	Advance-payment documents with partial-payment tracking
Tax invoices	GST invoices with HSN codes and CGST/SGST/IGST place-of-supply logic
Recurring invoices	Scheduled retainer and subscription billing
UPI QR codes	Scannable payment codes carrying payee, amount and note
Payment confirmation	Recipient-submitted payment references, recorded against the document
Finance Status	Client-grouped pipeline view across quotation → proforma → invoice → paid
Employee Registry	Team system of record with role-gated compensation
Role change notices	Formal, acknowledged role and compensation changes
Termination notices	Formal, acknowledged exits that archive the employee
Ex-Employees	Preserved archive of departed staff and their documents
Team Hierarchy	Draggable, connectable, department-coloured org chart
Offer Tracker	Live acceptance status, resend, share and edit for every offer
Task Board	Assigned tasks with priority, deadlines and automatic overdue detection
CRM	Four-stage drag-and-drop lead pipeline
Customers	Client database that auto-fills billing and GST details
Billing & Revenue	Income, expenses, profitability and category breakdowns
Product Planner	Roadmap items with status, priority and due dates

Recipient Portal	Account-free signing, acceptance, decline and payment confirmation
Portal links	Signed, expiring, revocable, scoped URLs
Bulk offers	CSV → validated → generated → individually linked offer letters
Bulk certificates	Batch certificate issuance
Bulk team import	Registry import from spreadsheet
Bulk History	Archive of batch jobs and their outcomes
Dashboard	Counters, revenue trend, document mix, activity feed, quick actions
Records	Permanent, searchable archive of every issued document
Notifications	Per-user inbox of recipient activity, routed to the right screen
Company Profile	Identity, legal, tax, contact, banking, branding and mail configuration
Image editor	Crop and position logos, signatures and stamps; WebP re-encoding
Registration wizard	Eighteen-step conversational setup with resumable progress
Roles	Owner, admin, member and viewer, enforced at the row level
Plans & metering	Free, Pro, Max and Enterprise with server-side usage counting
Themes	Light and dark, applied consistently including charts
Realtime	Live updates across devices and teammates
Admin console	Cross-tenant plan management and deletion, claim-gated
Audit log	Append-only record of significant actions

EDGEOS

Documents, finances, hiring, decisions — every operation distilled into one calm workspace, with an AI Co-founder that reads your live data and runs alongside you.
